

RoB 3.3 **Could** missingness in the outcome depends on its true value?

Example outcomes
Fatigue: If the authors write a sentence about some patients who were not showing up at the follow-up because they said they were too tired, then annotate this because the missingness depends on the actual/true value of fatigue.
Fall: If the patients did not show up to the final exam because they did fall and were hospitalized, then the outcome fall - missingness depends on the true value.
Assessors should reflect on the label the reason for missingness. Probably different labels are used, e.g., for the outcome fatigue, a possible explanation would be "exhaustion"?

Annotate full sentences if not otherwise specified to annotate only phrases.
